Phone Number: +1 832 804 5767

About me:

A results-driven Software Engineer with a track record in full-stack development and Quality Assurance. With previous experience enhancing application performance through SQL and PHP optimizations, and improving user experience for hundreds of daily users. Successfully created a new streamlined QA process and documentation, allowing the testing cycles to be reduced by 60%.

Core Skills:

C#/.Net | C++ | PHP | MySQL | Quality Assurance (QA) | Documentation | Prototype Developer | Unity | Unreal | Jira | SWOT Analysis | Codelgnitor | VR Developer | Collaboration |

Industry Experience:

Software Engineer, Gameplay - C++/Unreal Engine

June 2025 - Current

@ Archonik, Inc - Start Up

- Developed a corruption system that would dynamically give different intractable items a possible corruption score and, when interacted with by the player, would increase their internal corruption score.
- Collaborated with artists and animators to build an animation state machine, enabling seamless transitions across all character animations.
- Followed proper code review standards and practices while testing pull requests made by both the artists and other programmers on the team.

Software Engineer Backend - PHP/MySQL

2024 - 2025

@ Advanced Logistics Management

- Redesigned 12+ core modules within the company's project management software, **Invista™**, enhancing tasks and improving the intuitive design of the software.
- Optimized MySQL queries to improve the loading and download speeds for certain modules that were being visited by roughly 200-350 daily users.
- Developed an efficient back-end solution that allows designated users to track company vehicles. Allowing users and managers to understand the usage of all vehicles in the fleet.

Software Engineer Tester - C#/Unity

September 2022 - December 2022

@ XpertVR - Internship

- Managed project documentation - organized and updated records while consistently incorporating relevant information, allowing stakeholders to more easily find important information.
- Developed comprehensive quality assurance (QA) documentation for new systems, reducing the team's testing time from 5 days to 2 and streamlining the team's development process.

Software Engineer Gameplay - C#/Unity

February 2021 - July 2021

@ Consorcio Minero Horizonte - Contract

- Lead a pilot project to create a simulated version of a subterranean mine to help train people on safety procedures.
- Designed an event system that allows for easy creation of new tasks to equip users with the skills required when operating in a mine.
- Communicated with all stakeholders about requirements and necessary tasks to take the project into a production-ready state.

Projects:

Software Engineer, Gameplay/Engine - C++/Scratch

March 2025 - January 2026

Personal Project - Part-time

- Crafted a collision detection system that halts player movement and allows for player-specific interactions, all while managing memory and object lifecycles.
- Engineered a custom KD-Tree system to categorize and manage collision objects (static walls, interactive buttons, destructible elements) for ultra-fast spatial queries.
- Implemented an efficient culling system that queries the KD-Tree every 0.75 seconds to check for local objects that could be collided with by the player, allowing the game to reach the target 120 FPS.

Software Engineer, Front End - Next.js

August 2025 - November 2025

Personal Project - Part-time

- Developed the frontend for a web application using Next.js, implementing a dynamic calendar component allowing users to have more granular control over date selection.
- Integrated into an Agile team environment, participating in the design and development of rapid, iterative cycles for the application.
- Engineered connections between the frontend and backend by integrating RESTful APIs, ensuring accurate data retrieval and display

Software Engineer, Gameplay - C#/Unity

August 2024 - December 2024

Personal Project - Part-time

- Implemented an algorithm that receives integers with more than 7 digits and reduces them to 3 integers with the appropriate denomination using the logarithm of the value.
- Made a UI system that would unlock new buttons and systems after players reach certain events, allowing users to have a sense of progression with the gameplay mechanics.
- Created an algorithm that dynamically changed the in-game costs, which would dynamically change the best options for the player to choose as the game progresses.

Software Engineer, Gameplay - C#/Unity

January 2023 - August 2023

Personal Project - Part-time

- Initially created an FSM AI that would react to player movement and attacks, as well as change the NPC actions based on whether the player is attacking them.
- Upgraded the FSM into a Hierarchical Finite State Machine, allowing the AI to have more streamlined states, and added a search state in the player's last known position.
- Implemented a QA system by having each AI create a personal UI canvas that would display the AI's current state, health, and other needed information. Allowing for easier and quicker QA testing of the AI's state.

VR Lead Software Engineer - C#/Unity

September 2022 - May 2023

Capstone Project

- Collaborated with a 15-person team through an eight-month development cycle to launch a Virtual Reality (VR) mental health project.
- Implemented the Oculus Quest 2 VR system using C#, enabling user interaction with the virtual environment.
- As the Technical Lead, managed code reviews and architected system assignments based on individual programmers' expertise, mentoring junior developers to ensure code cohesion.

Education:

Brock University

2019 - 2023

Bachelor Honors; Interactive Arts And Science - Computer Science

Languages:

Fluent: English, Spanish
